

A responsible approach to nature and humankind is an indispensable and natural part of our corporate culture. Respectful behaviour determines our strategic alignment with the goal of long-term growth in value.

By doing so we protect the health of our employees, secure the continued existence of the industry and contribute to the maintenance of an environment that is worth living in.

Resources are valuable

It is standard practice for us that we comply with the required safety provisions as well as international guidelines on wastewater neutralisation in our branches. Through internal measures for water treatment and purification, we create a closed circle, for other commodities too by the way, and thus protect their resources. It is not just CylHub®, our concept for the ecological and economical exchange of recycled cylinder bases, that ensures appropriate sustainability.

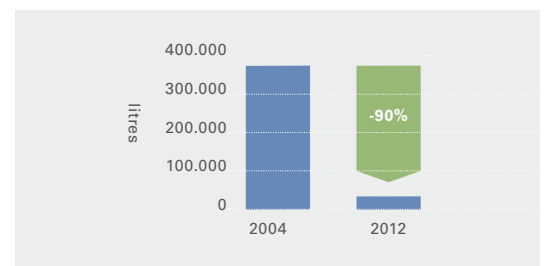

Thinking ahead for the future

We use the latest technologies in all of our production facilities. In close cooperation with the manufacturer side, we are constantly working on the development and optimisation of process technology in order to reduce our energy consumption and minimise emissions into the air and water. The testing of new light sources in laser technology with a longer shelf-life and significantly lower energy consumption is just one example on the way to sustainable production.

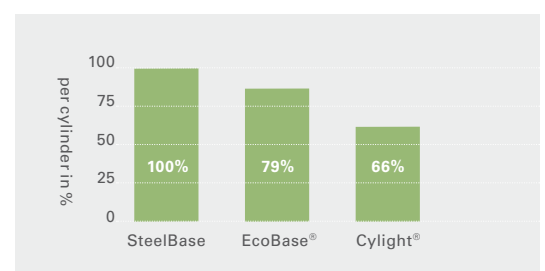

Living the philosophy

We think it is important to encourage all our staff to protect the environment and nature. Thanks to the Green Car Policy, by 2015 the CO² emissions of all new cars in the fleet will be 120 grams per kilometer on average.

Reducing fresh water consumption in cylinder production

CO² - emissions in the production of bases

Already since 2010, all Janoschka subsidiaries in France have been certified with the Imprim'Vert eco-label, a "green printing" initiative.
