

Anti-counterfeiting security is imperative when printing banknotes and official documents. However, security applications can also protect against product piracy or emphasise the exclusive nature of a brand. The fields of use are varied and the manufacturing process is complex: the combination of finest design elements, special inks, lacquers and encryption mechanisms already requires very specific expertise in artwork and reproduction. The translation from data to printing form must take place with maximum precision.

Together with our clients we design security applications, which are tailored to their individual requirement and guarantee a professional implementation. The examples shown are produced in gravure and give a realistic impression of the very diverse options available.
